PLATFORMLESS MODERNIZATION

# Modern Enterprise Architectures with APIs

Vidura Gamini Abhaya, PhD  
Vice President – Solution Architecture  
WSO2

**How Many APIs Do You Use ?**

# API Usage in Modern Organizations

**Average Number of API endpoints per Organization – 613**

(State of API Security 2024 - Imperva)

**55% of the Organizations have at least 500 APIs**

(2025 Global State of API Security - Traceable)

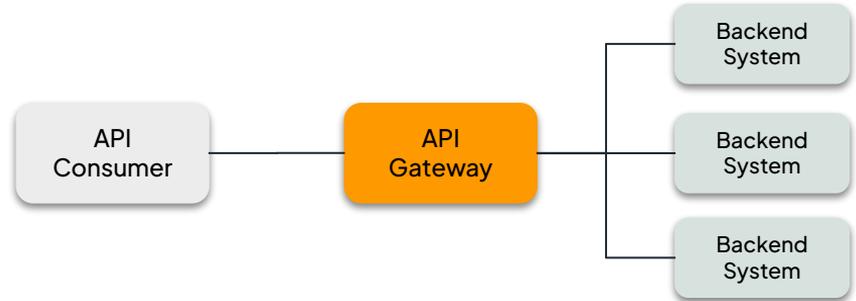

## Enterprise Architecture

The right Enterprise Architecture allows your organization to be agile, scalable and be truly inter-connected

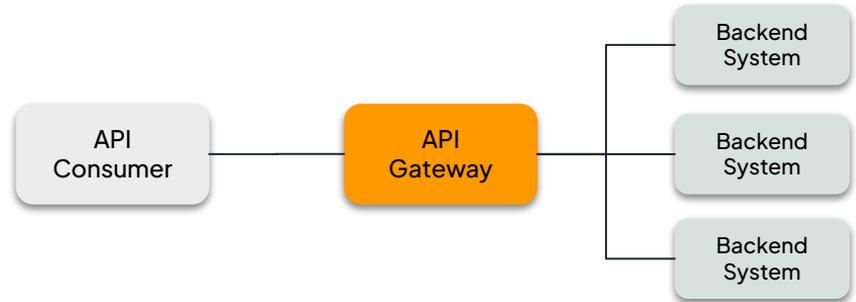

# APIs in Enterprise Architecture

- **API Gateway**
  - Secure Access to API
  - Ensure fair usage
  - Expose versions of the same API

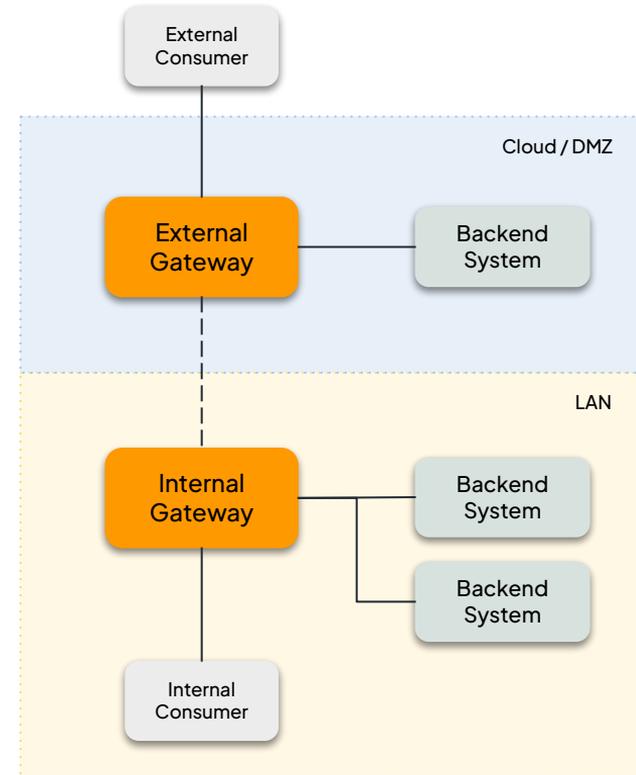

# APIs in Enterprise Architecture

- API Gateway
- API Façade
  - ◉ Hides the complexities behind GW
  - ◉ Simplified API to Consumer

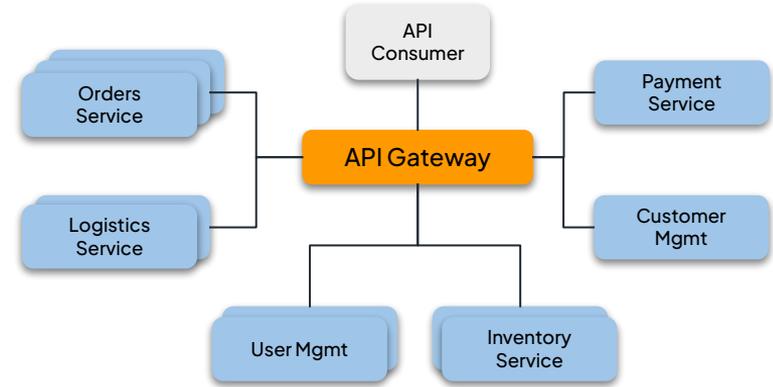

# APIs in Enterprise Architecture

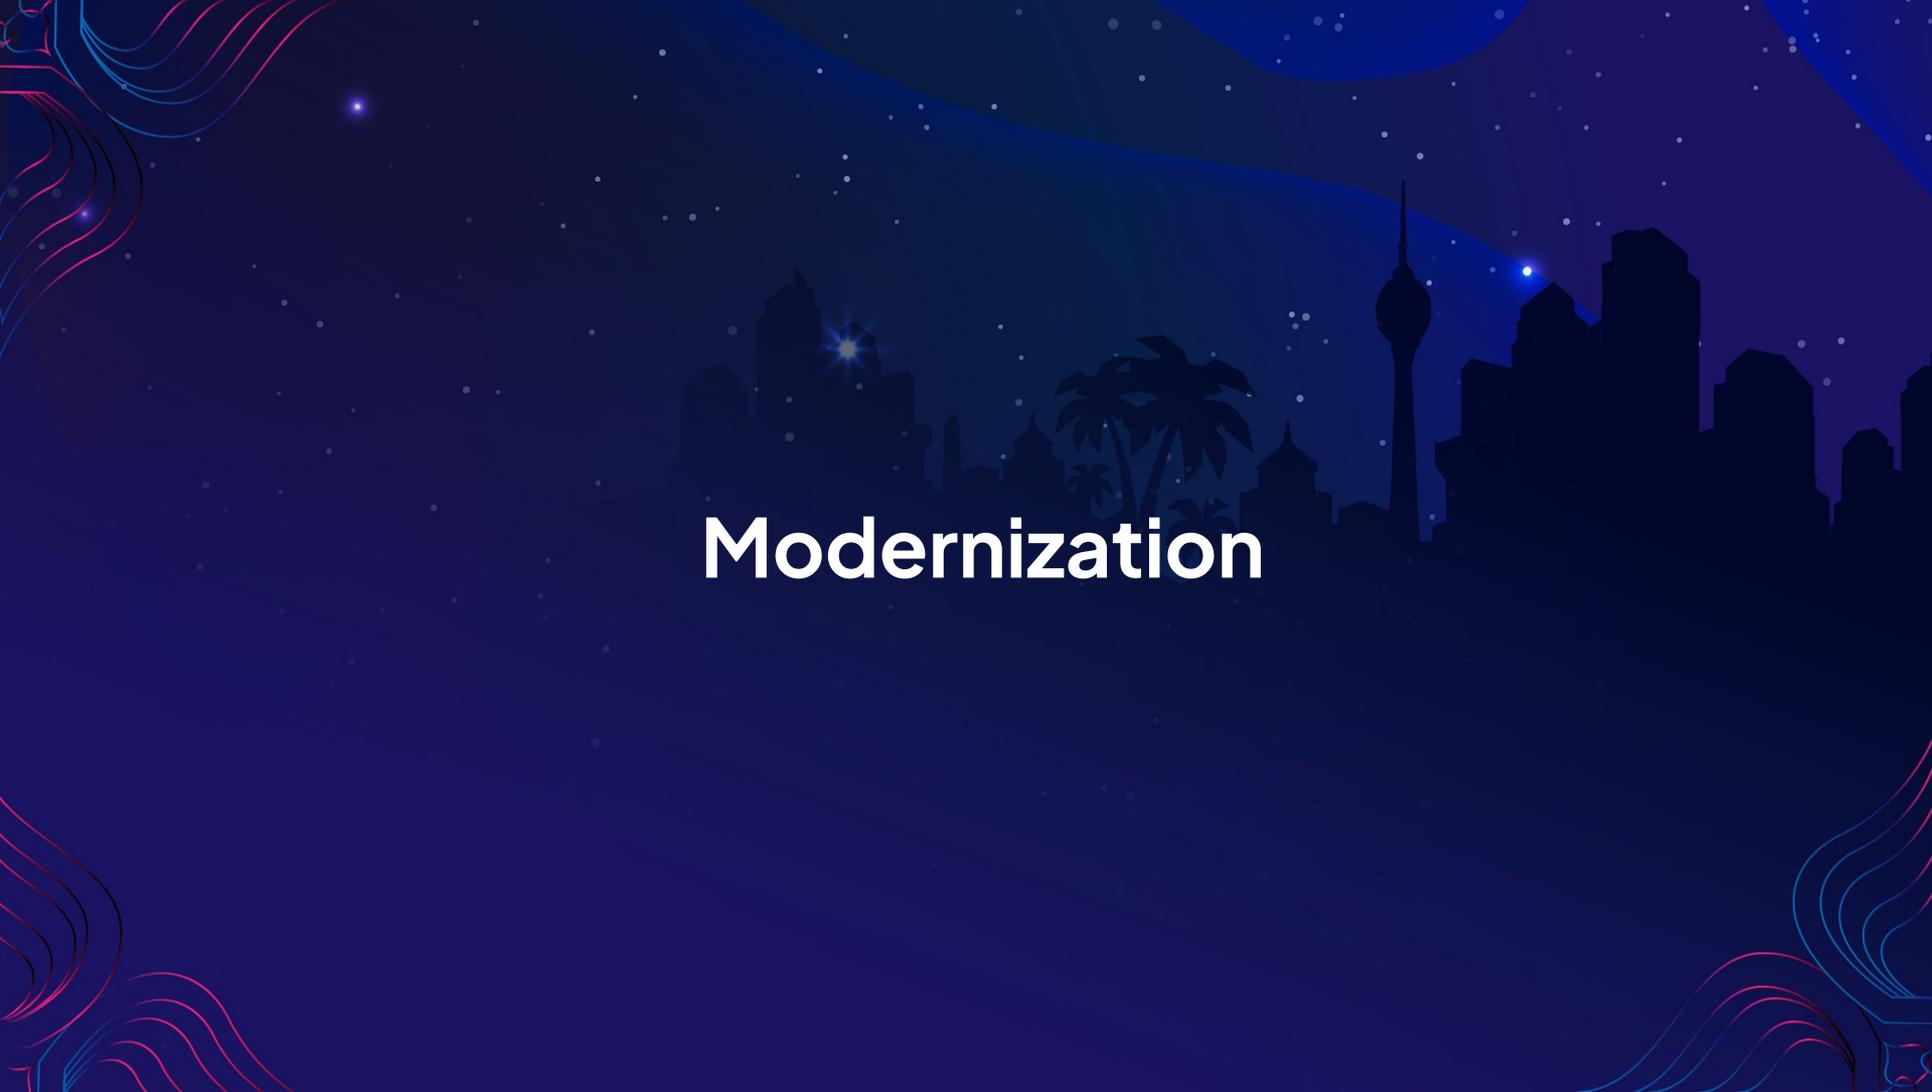

- API Gateway
- API Façade
- Internal and External Traffic Separation
  - ◉ Separate network boundaries
  - ◉ Different policies for different traffic types
  - ◉ Enhanced Security

# APIs in Enterprise Architecture

- API Gateway
- API Façade
- Internal and External Traffic Separation
- Microservices Architecture
  - Services can be deployed and managed and scaled independently
  - Increased Agility
  - Services can be polyglot

# Modernization

# Modern Enterprises

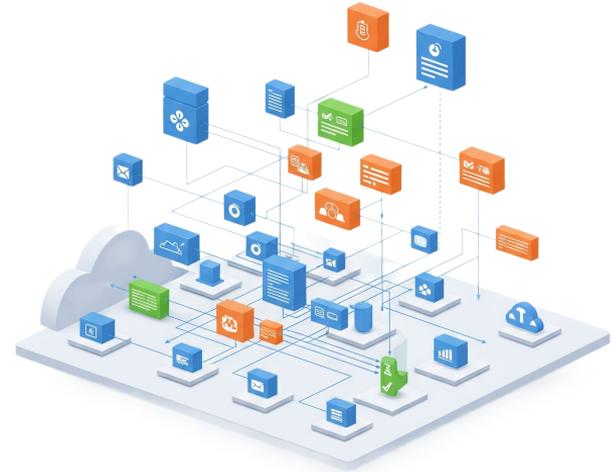

Modern Enterprises are more decentralized, have multiple teams working on different aspects of Digital Experiences they build for their stakeholders

**Modern Enterprises need  
Modern Enterprise Architectures !**

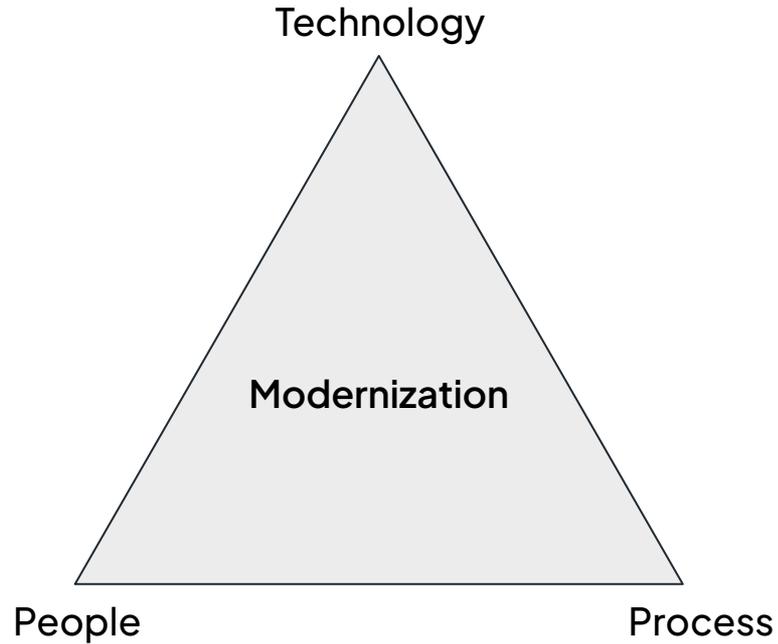

# Modern Enterprise Architectures Allow You...

- **Composability**
  - Move towards smaller, independent, deployable units
  - Agility, fault isolation, independent scaling
- **Decentralization & Domain-Driven Design**
  - Empowers teams to own their services and data
  - Align architectures with business domains
- **Cloud-Native principles**
  - Leverage Cloud Services
  - Scalability, Resiliency and cost-efficiency
- **Emphasis on Data Flow and Real-time capabilities**
  - Allows data to flow freely and be accessible easily
  - React to events when they happen

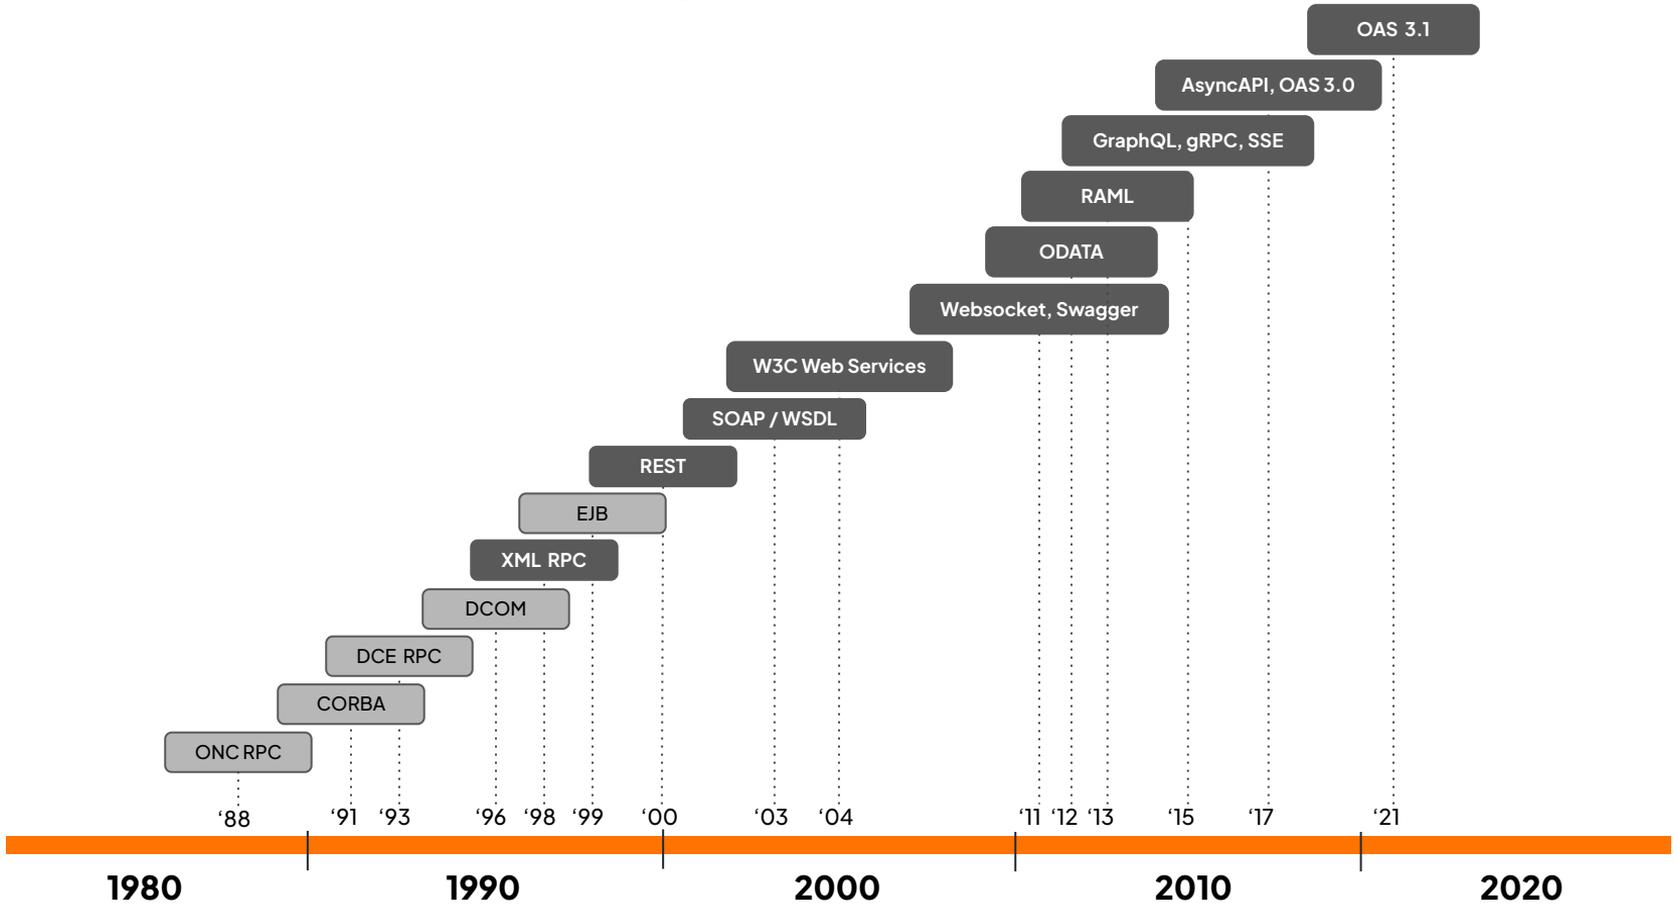

# Pillars of Modernization

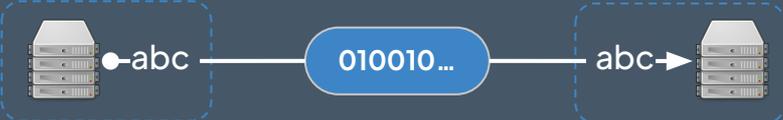

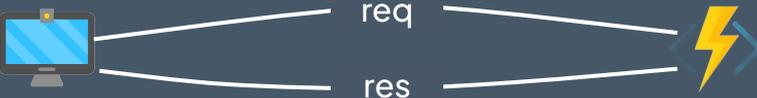

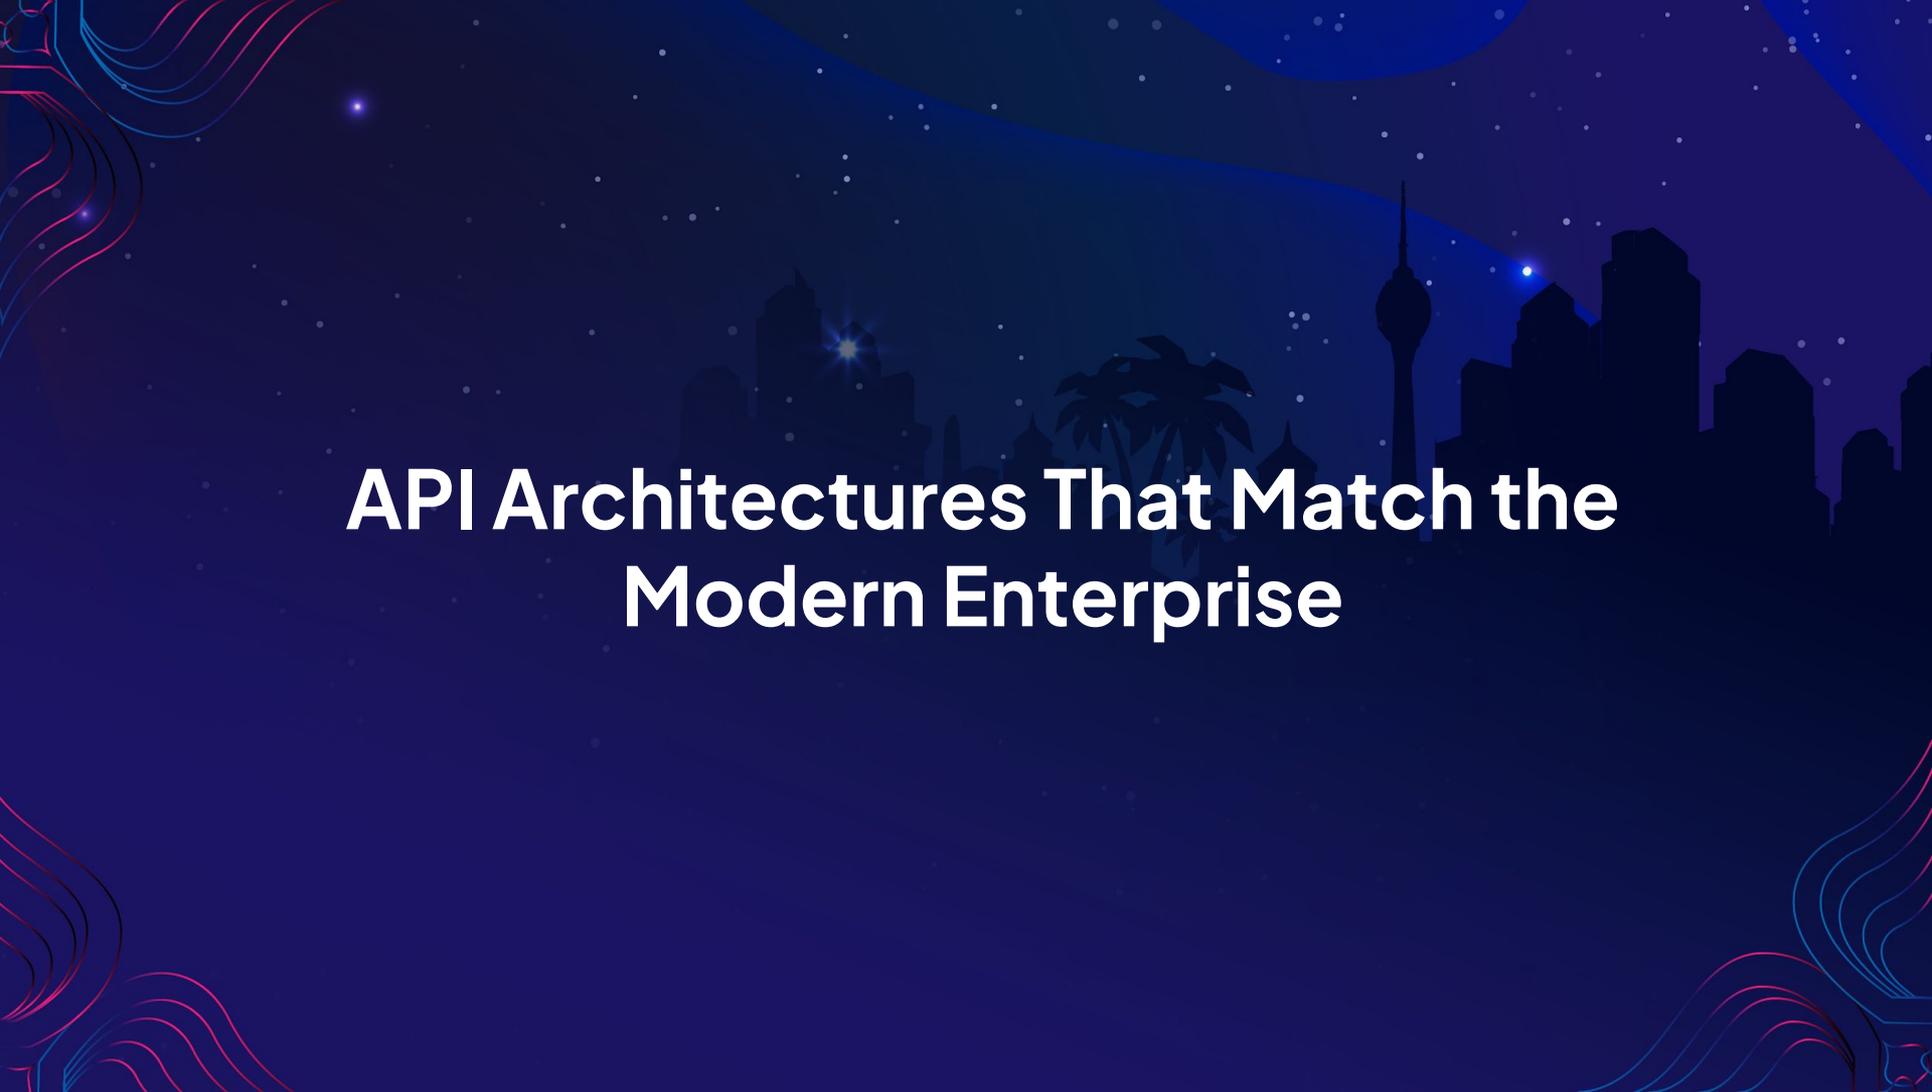

# Modern API Technologies and Specifications

# Evolution of API Technologies and Standards

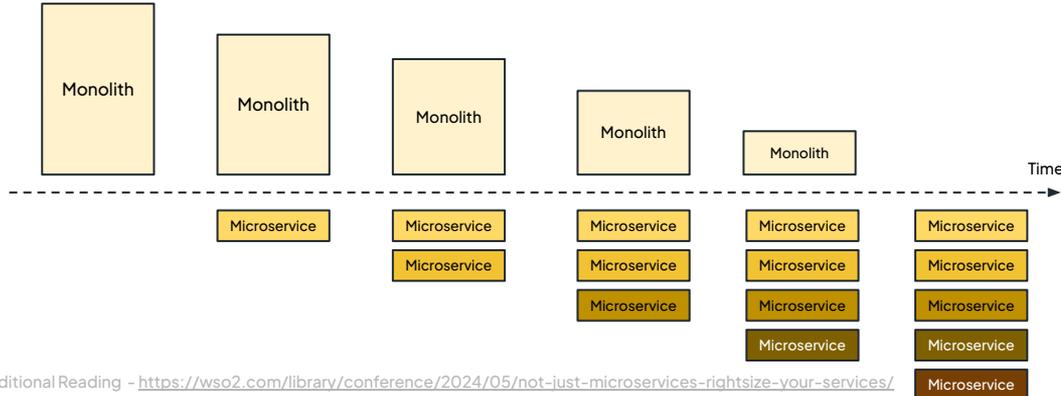

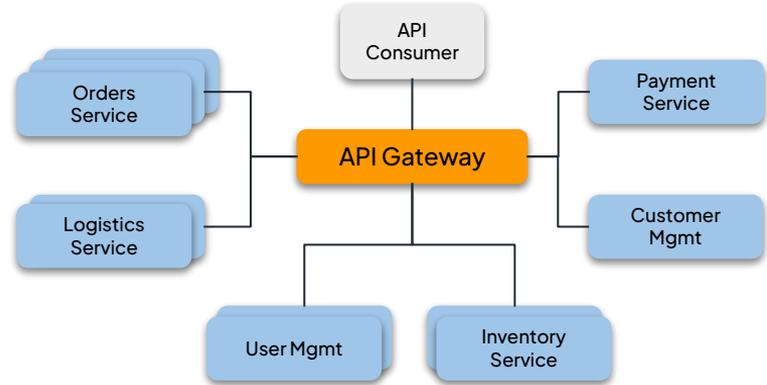

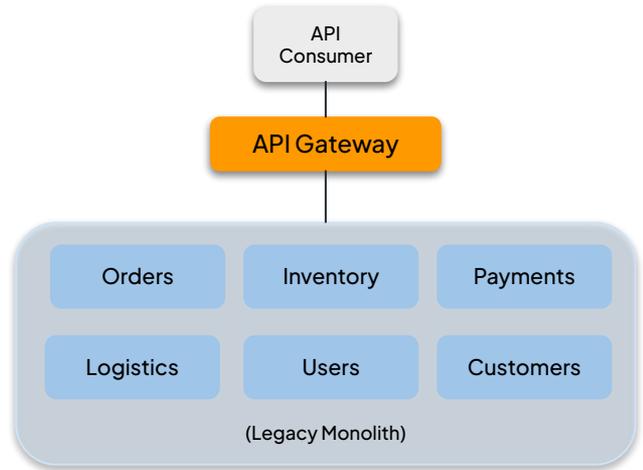

# Modern API Architecture Styles

 RESTful		Resource-based for web servers
 GraphQL		Query language reduce network load
 gRPC		High performance binary protocol
 WebSocket		Bi-directional for low-latency data exchange
 Webhook		Asynchronous for event-driven application
 Serverless		Easily scalable code Snippets written as functions run on cloud

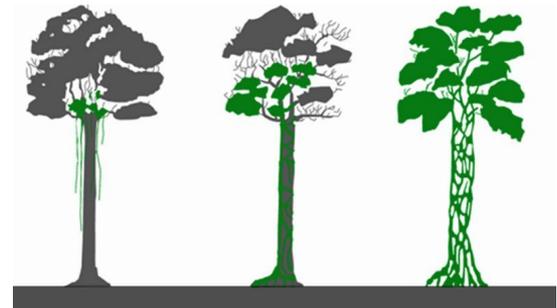

# API Architectures That Match the Modern Enterprise

# Monolith to Microservices Architecture

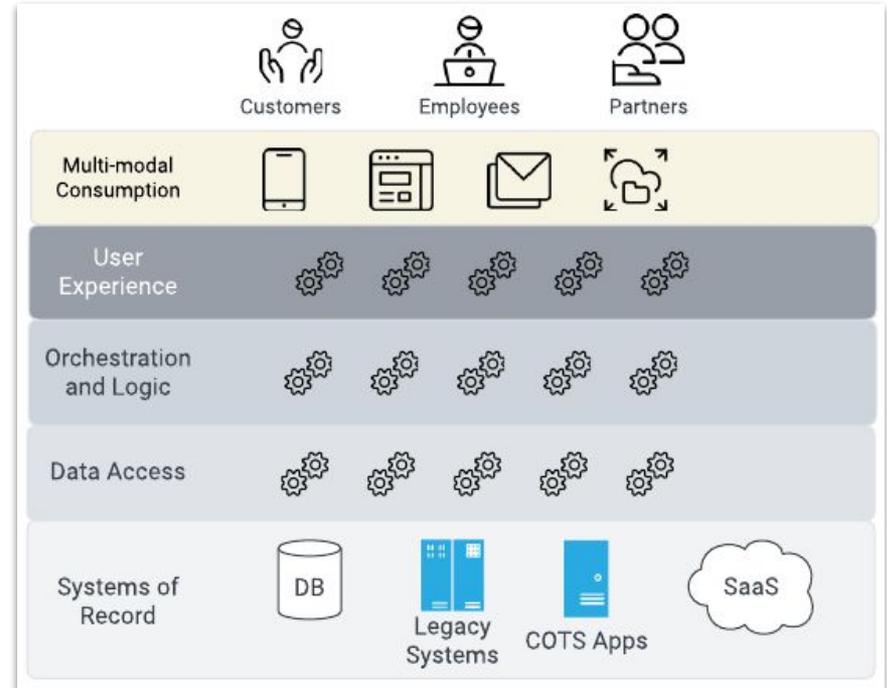

Strangler (Fig) Pattern

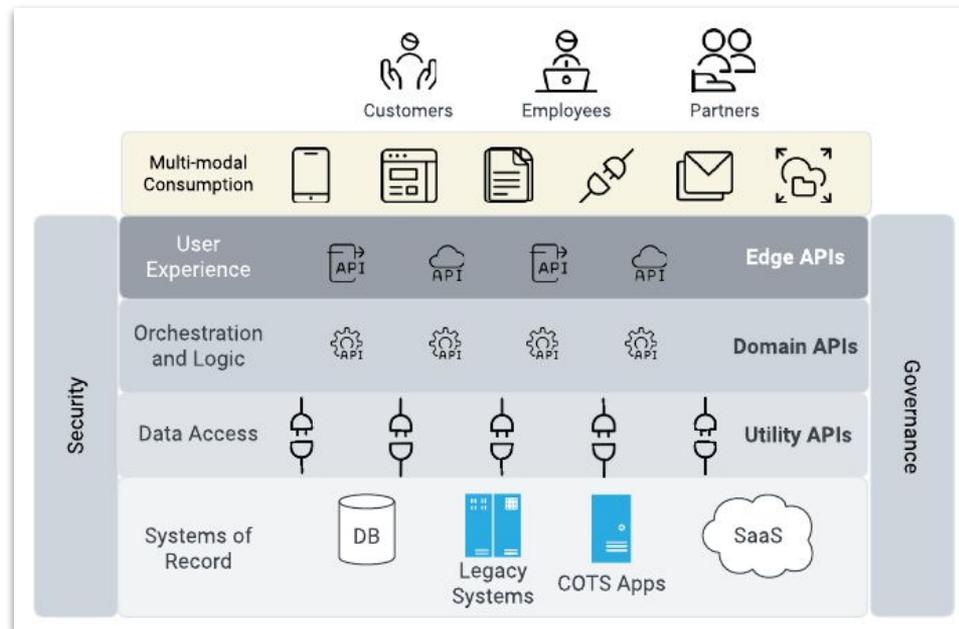

# Layered Architecture

- A common EA pattern
- No of layers and what they are, may differ
- It's a natural progression of things in computing from centralized to decentralized
- Components are grouped together by function
- Layers may reflect how teams operate in an organization (can be centralized or decentralized)

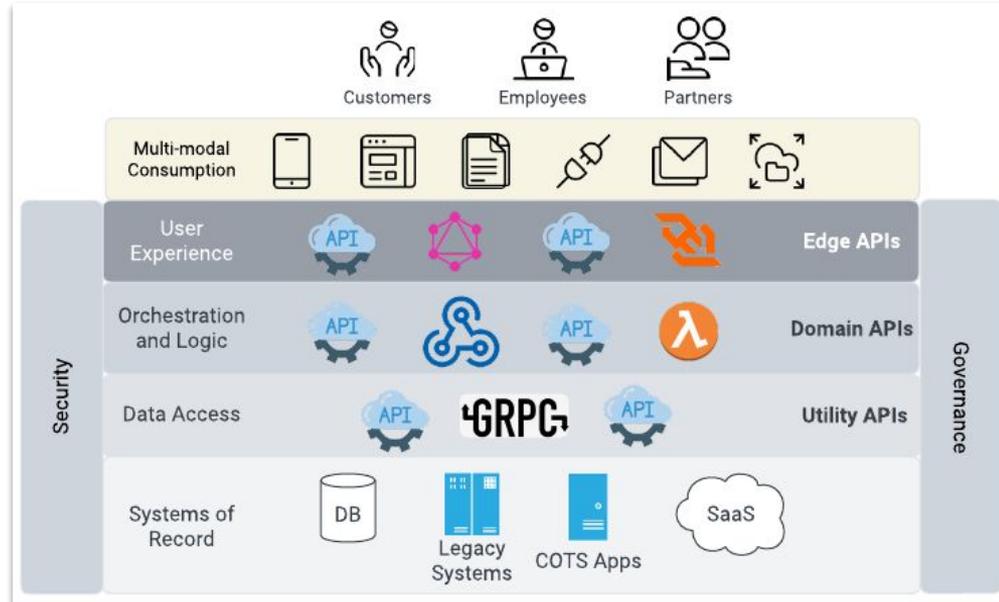

# Layered API Architecture

- Use of APIs in each layer brings their inherent benefits (decoupling, open standards, agility, etc.)
- Can be combined with MSA (Each API could be a Microservice)
- Add the missing layers to your current architecture
- First step of being decentralized

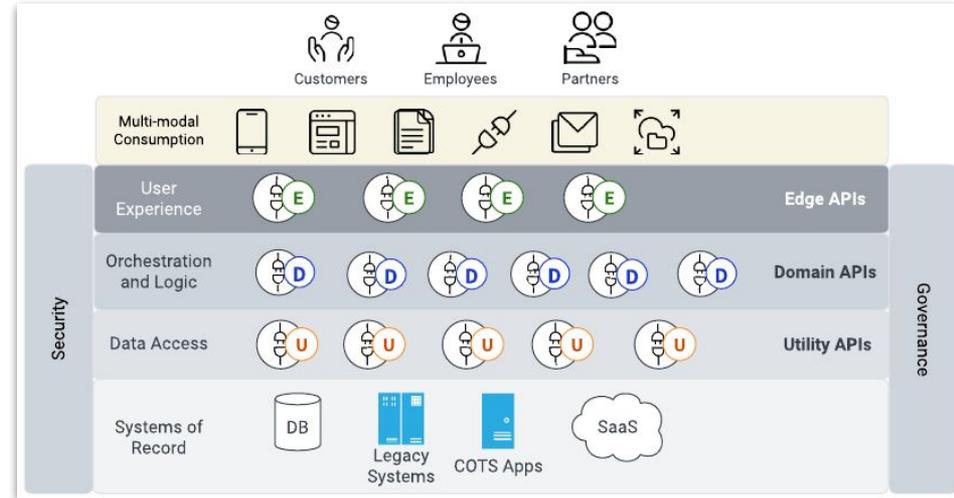

# Layered API Architecture

- API Architectural styles can be used in implementing APIs in each layer
- GRPC for high performance data exchange
- GraphQL for better Ux
- Async APIs such as Websockets (bi-directional data exchange) and Webhooks for Server initiated calls
- Allows non-disruptive introduction of new technologies

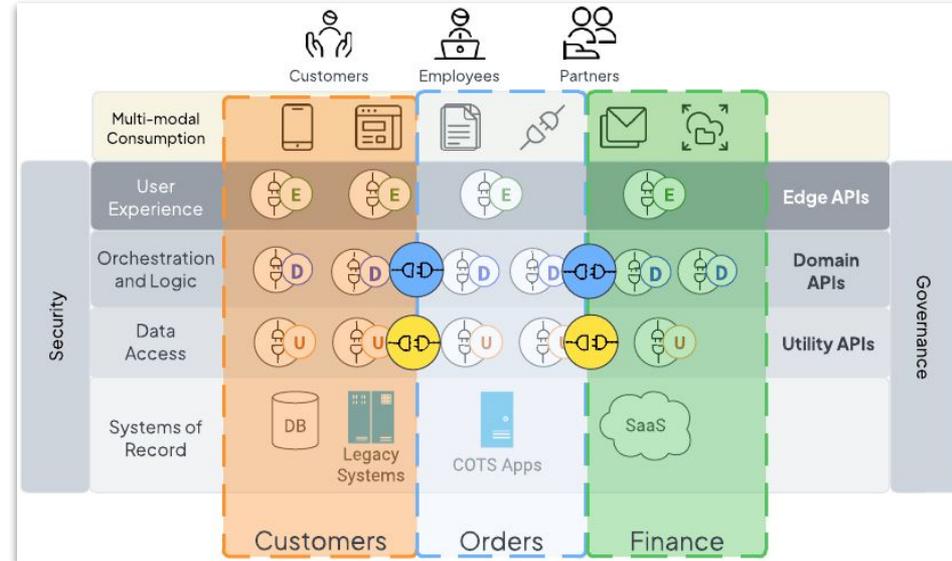

# Segmented API Architecture

- Retains the same basic structure and principles of Layered
- Segmented based on how enterprises are organized
- Can be BUs, Functional Teams, or Centres of Excellence
- Segment own everything in all layers
- Sub-teams (two-pizza sized) may work on individual layers
- More freedom and ownership

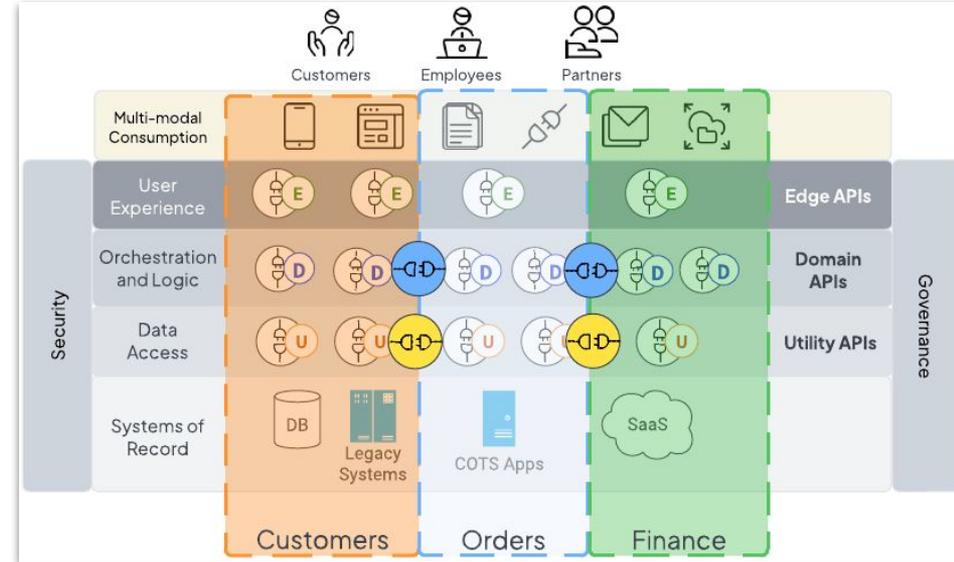

# Segmented API Architecture

- Retains the same basic structure and principles of Layered
- Segmented based on how enterprises are organized
- Can be BUs, Functional Teams, or Centres of Excellence
- Segment own everything in all layers
- Sub-teams (two-pizza sized) may work on individual layers
- More freedom and ownership

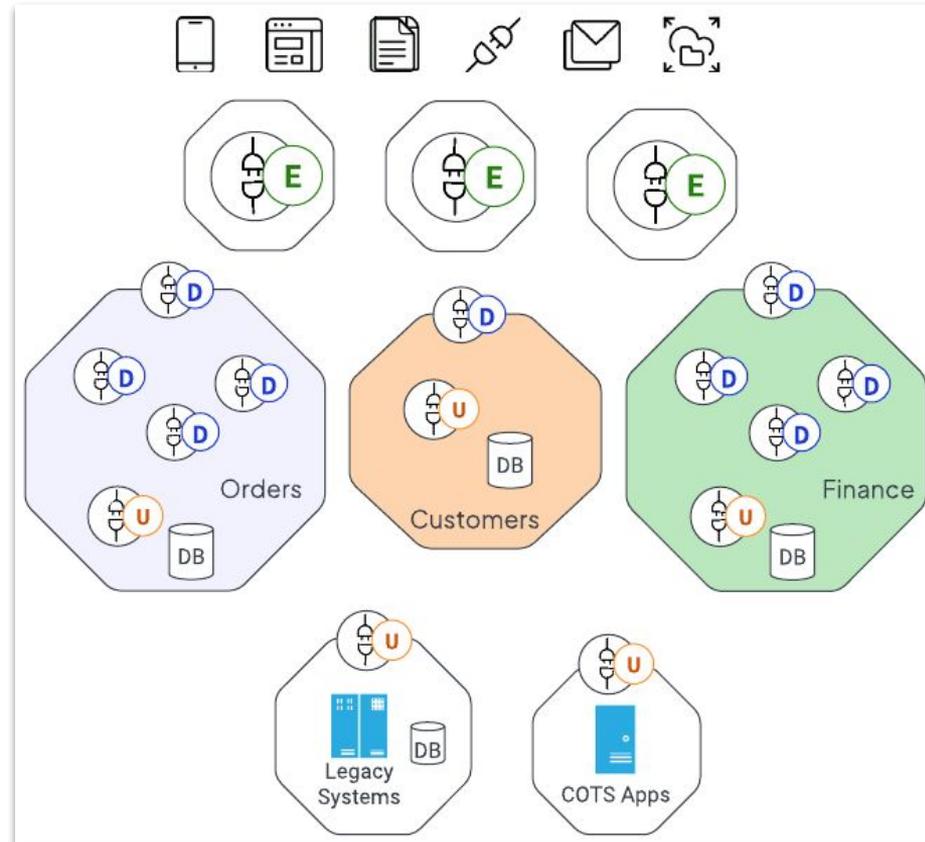

# Segmented API Architecture

- APIs are used for communication between layers and segments
- Segments could be separated using Runtime partitioning, Multi-tenancy
- In larger organizations, each segment may have their own platform
- Platform of platforms !

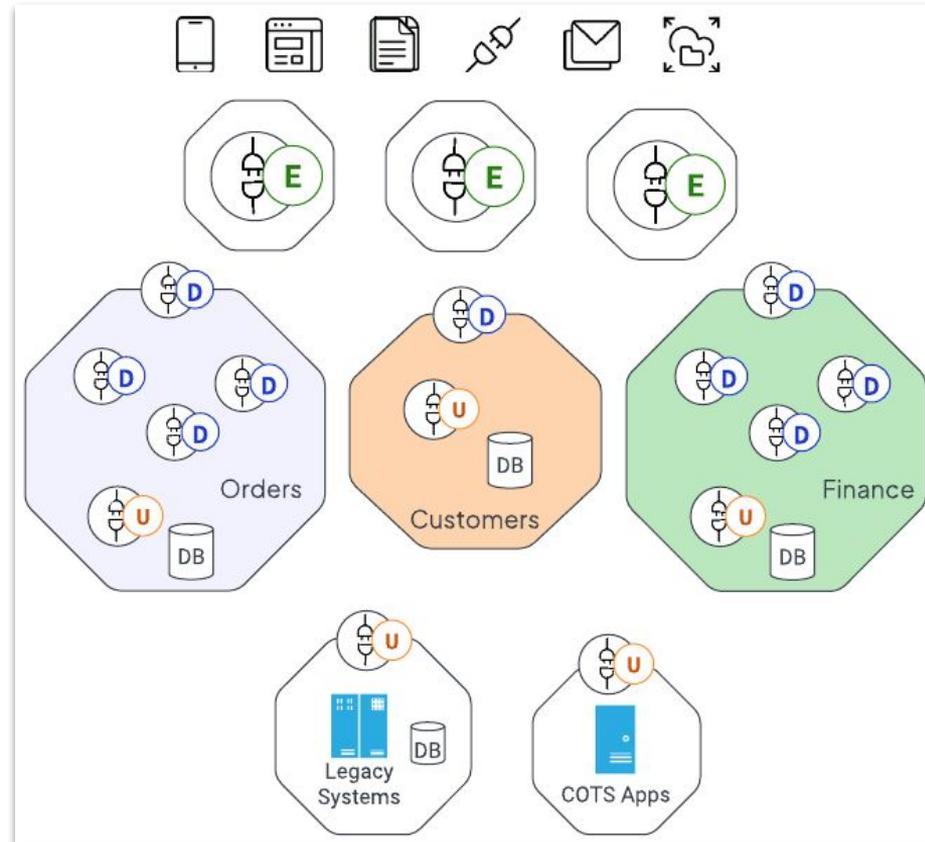

# Cell-based API Architecture

- Cell is a collection of one or more components (APIs)
- Designed, implemented, deployed and managed together
- Each cell has a capability and it is network accessible through APIs
- APIs used for
  - ◉ Inter-cell communication
  - ◉ Intra-cell communication
- Isolation of cells can be physical or virtual (VMs, Containers, etc.)

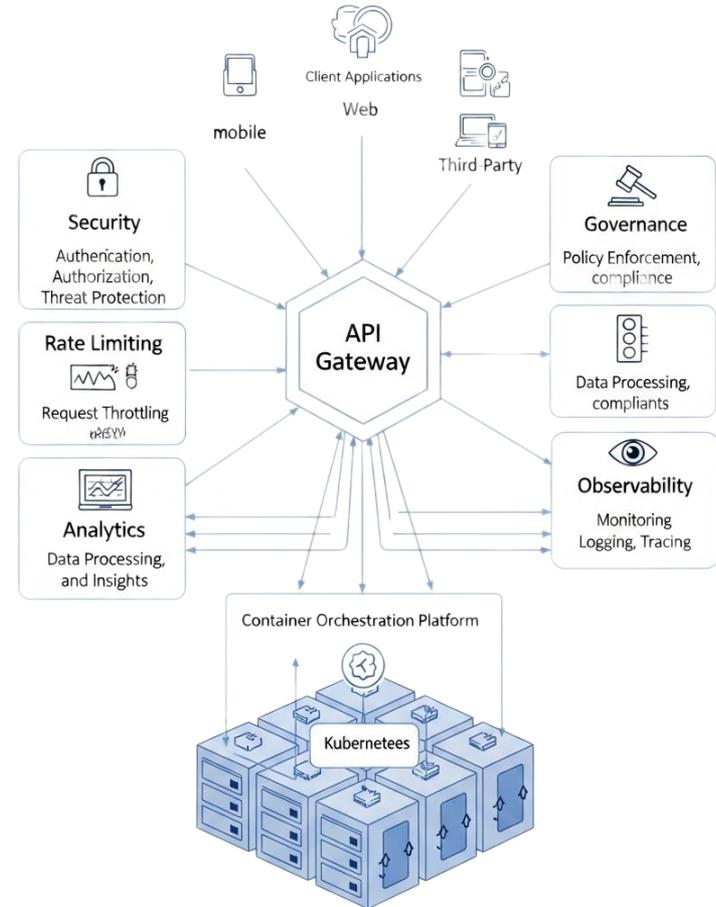

# Cell-based API Architecture

- Cells can be versioned
- Deploying all components in a cell can be automated (CI/CD)
- Increased agility and isolation (vs Layered, Segmented)
  - ◉ Component level iteration
  - ◉ Cell Level iteration
  - ◉ Architecture level iteration
- Cells can be created by grouping existing (Micro)services
- A team can own one or more cells

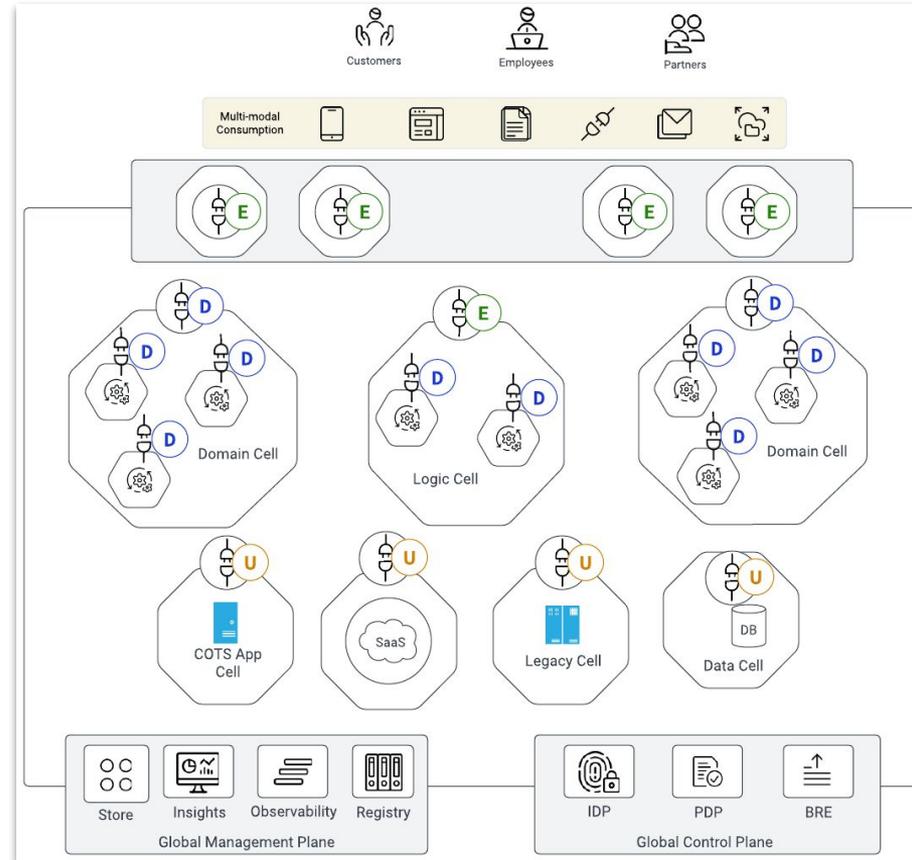

# Cross-cutting Concerns

- Security
- Governance
- Rate Limiting
- Observability
- Insights and Analytics
- Deployment Architecture

# Implementing Cross Cutting Concerns

- Most of these can be implemented at a global level
- Some such as security and rate limiting may be implemented locally (i.e. within a cell)
- Hybrid is also a possibility
- Modernize processes such as how APIs, cells, features are versioned and deployed
- *Cloud-Native API Architecture*

# Key Takeaways

- Modern organizations need Modern Enterprise Architectures
- They allow you to adopt new tech, new org structures and processes
- Empowers teams to be decentralized and be more agile
- Start simple and adopt new EA as you grow  
(Layered -> Layered + MSA -> Segmented -> Cell-based)
- It's not a one time decision, but a process
- All API Architectures can be implemented using WSO2  
(If you need help, please talk to us)
- You can also go platformless with Bijira !

A dark blue background featuring a silhouette of a city skyline at night. The skyline includes various skyscrapers and a prominent tower with a spherical top. The sky is filled with small white stars and a few larger, brighter stars. In the top left and bottom left corners, there are decorative wavy lines in shades of blue and pink. A thin orange horizontal line runs across the middle of the slide.

# Question Time!

Thank you!
