Internal Developer Platform: 3 Layer

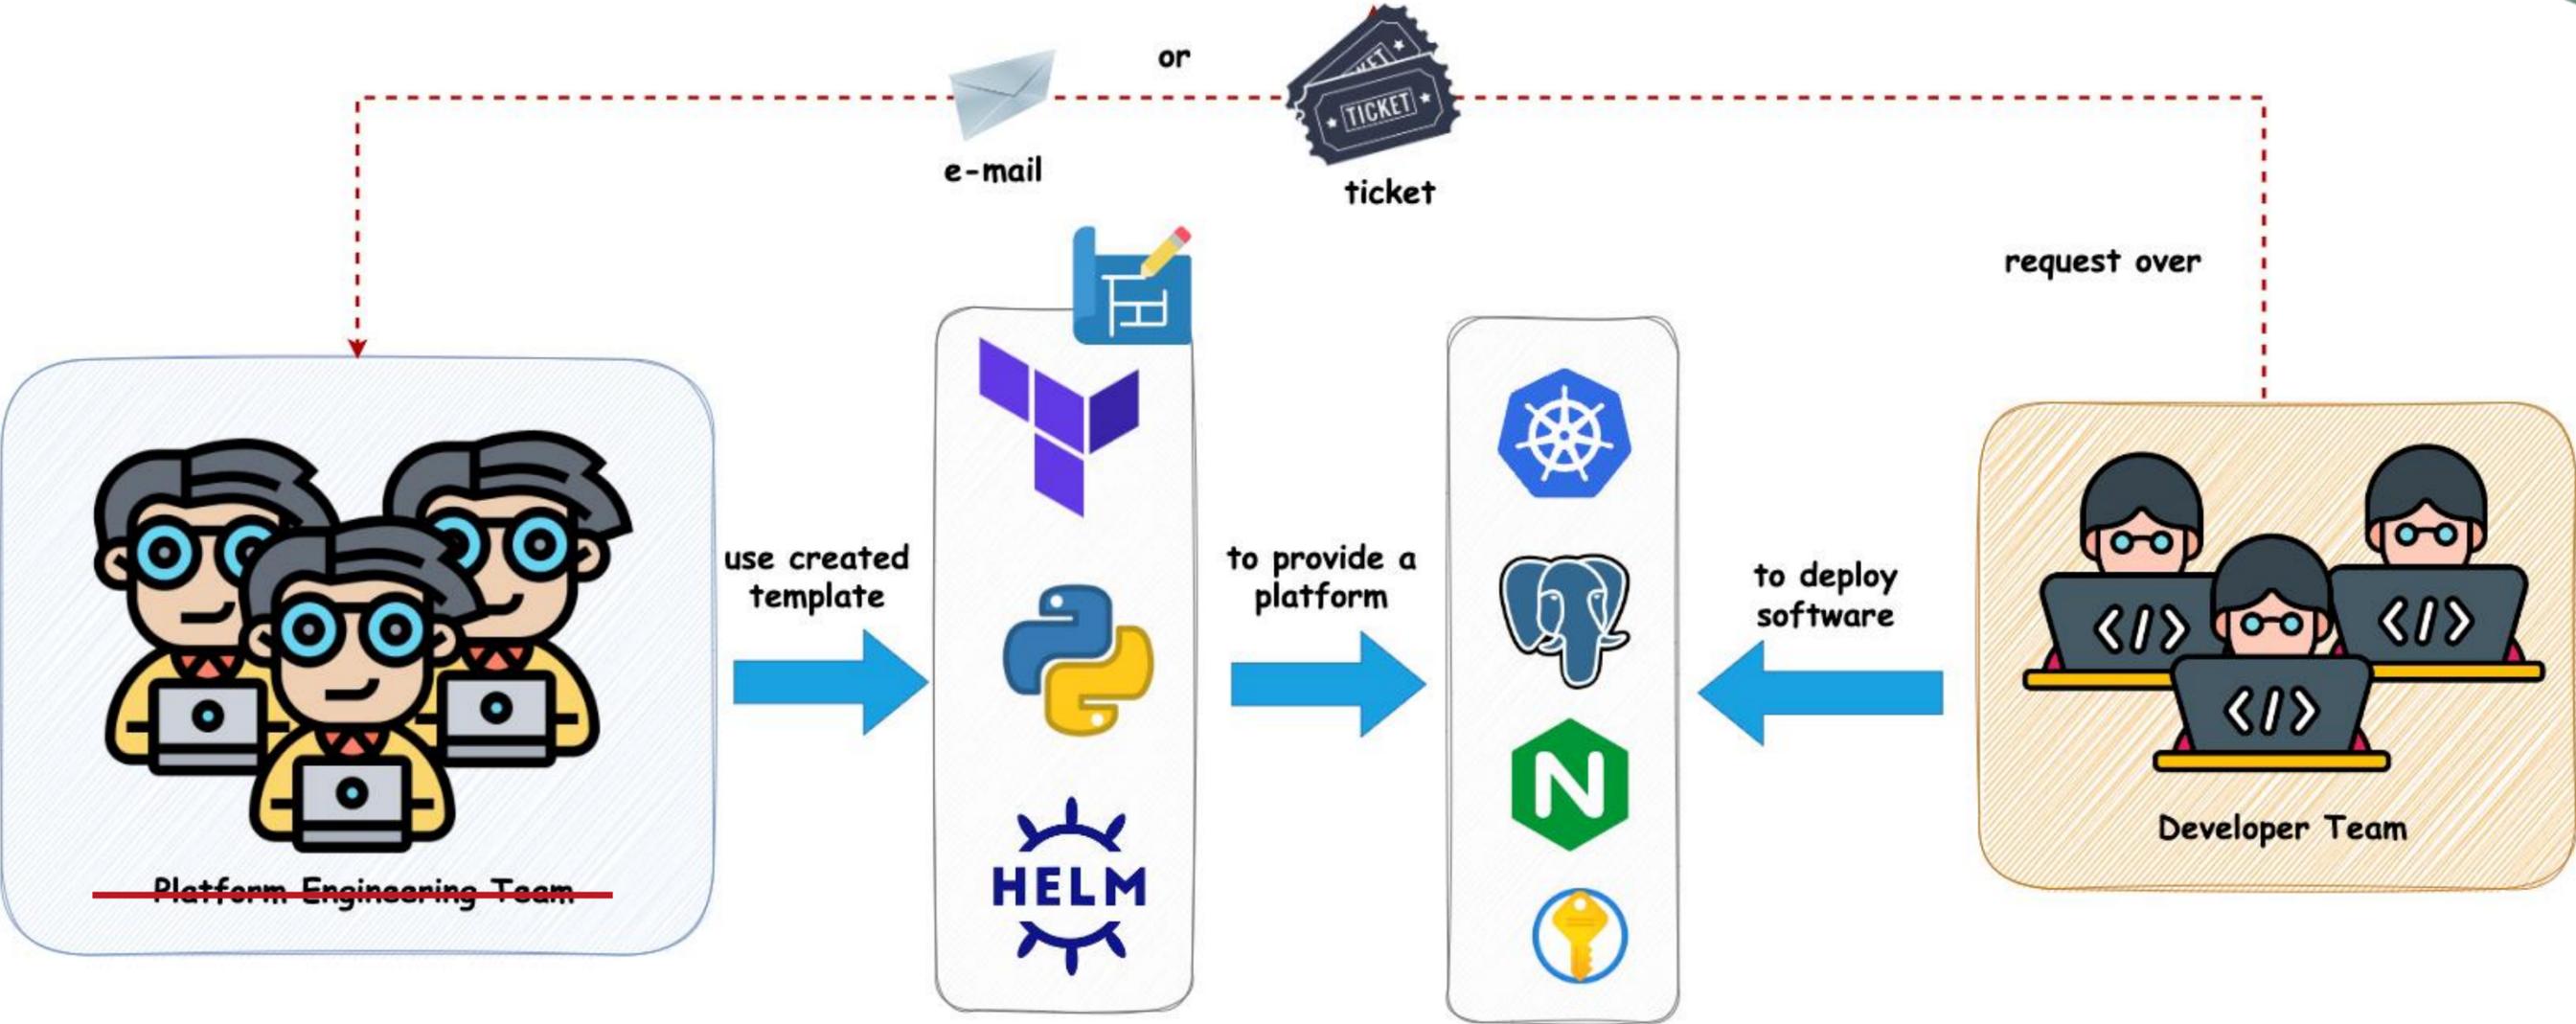

Platform Engineering

Is **ABOUT** abstracting or compose individual services, building an overlay, and making them **self-service consumable** by the end user.

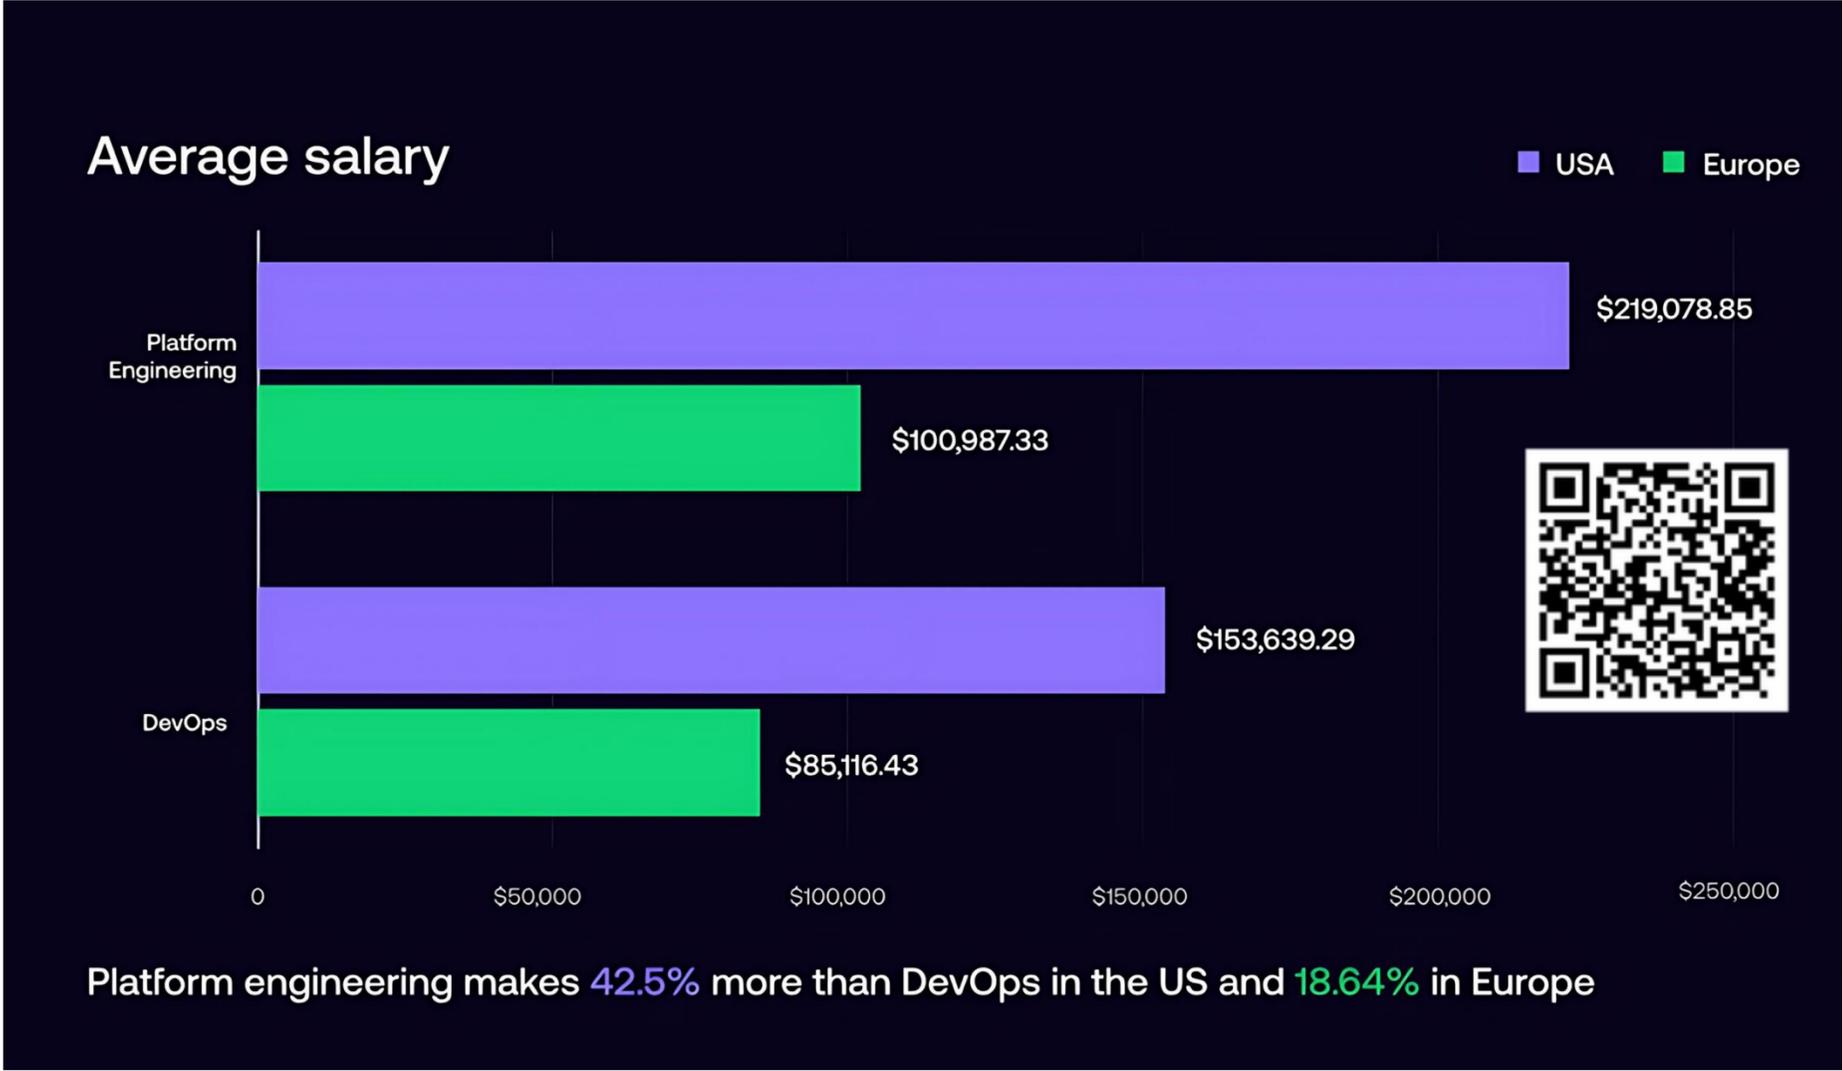

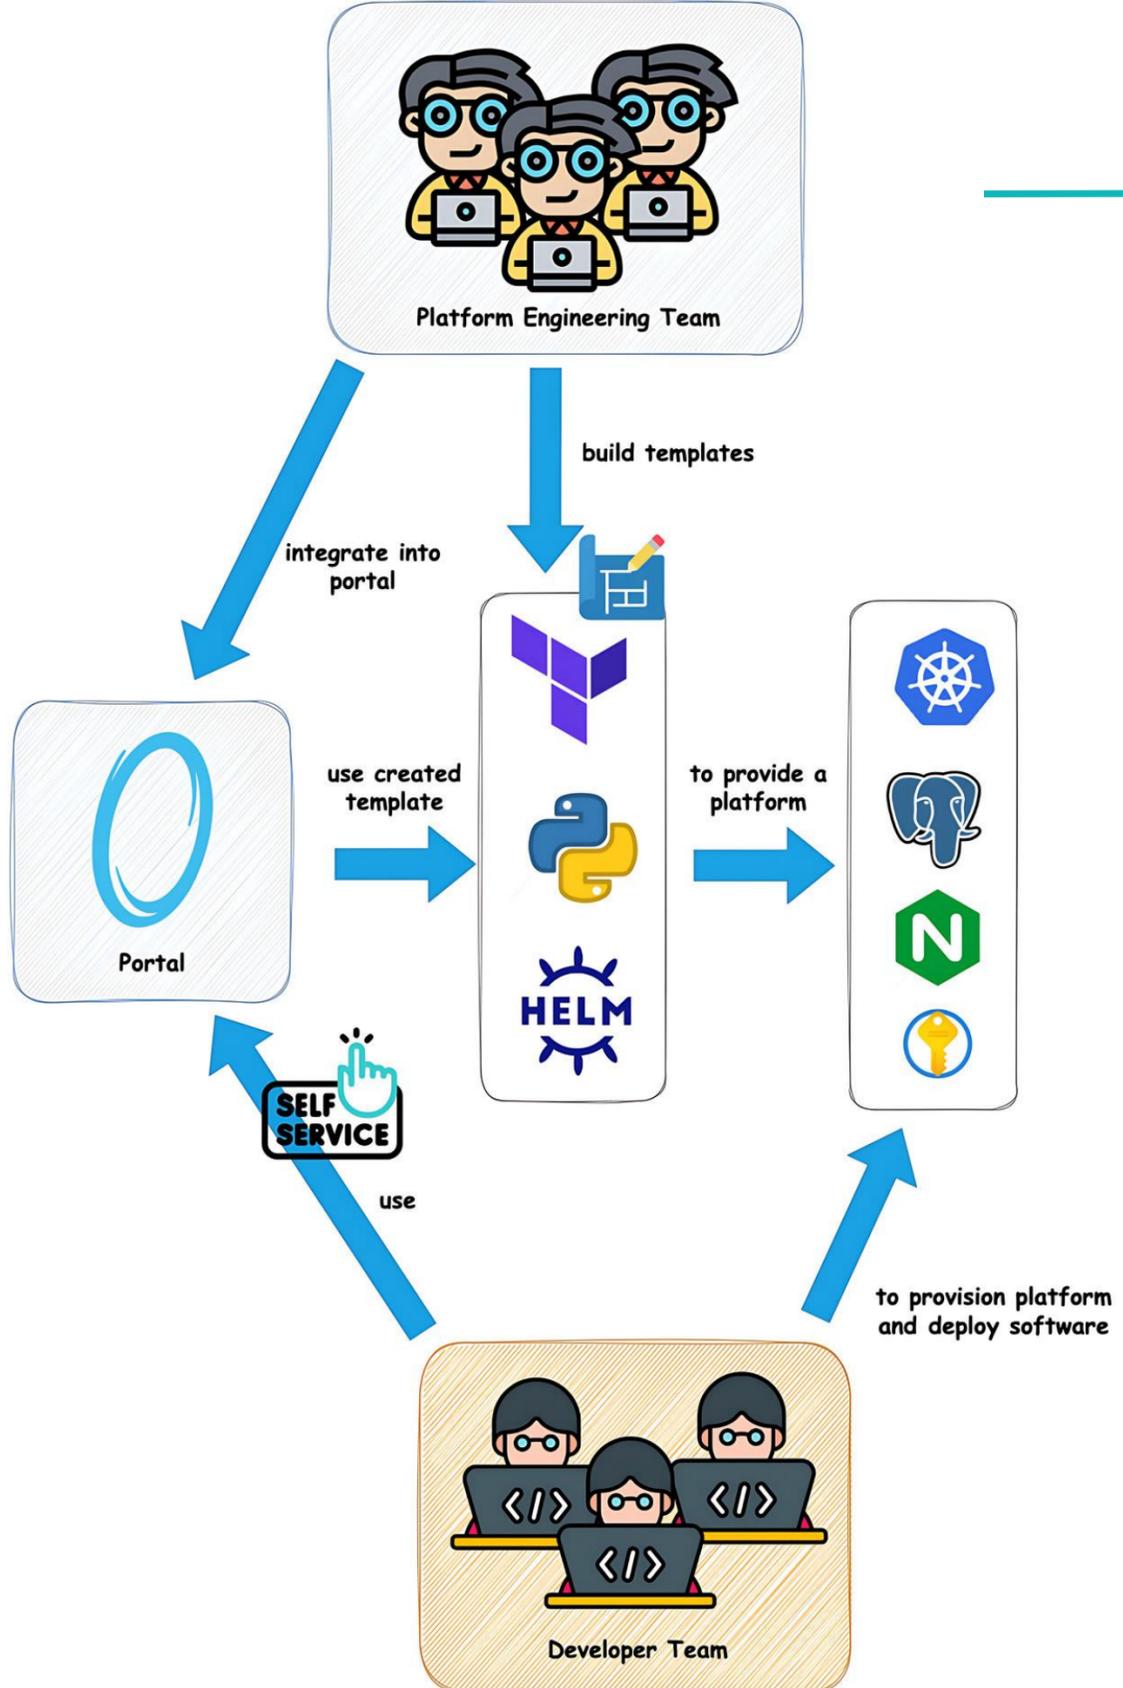

Is **NOT ABOUT** abstracting or compose individual services, building an overlay, and using them internally to **provide infrastructure**. If that's your approach, you're **not** a Platform Team—you're a **Managed Infrastructure Team**.

Managed Infrastructure Team

Infra Teams owns the Platform!

Platform Engineering Team

Platform Teams owns the Interface (IDP)!
Developer Teams owns the Platform!

Establish a Platform Team / Build an IDP

- Will cost you ~\$1 Million/year
- Why?
 - 5–8 Platform Engineers & SREs → \$100k+ avg salary
 - Infra costs — Kubernetes is free, but it doesn't run in the air
 - Tooling & subscription costs add up fast
- Neil Cresswell (CEO of Portainer.io) wrote a blog on this!

Security Audit Hits Hard!

- Involved in 2–3 major audit preps 2024/2025
- CVEs on top of CVEs — some dating back to 2013!
- Don't patch blindly: understand the issue, disable unused features
- Management will ask: “Why are we spending millions on this platform?”

Breathe!

- IDP and Platform Engineering – Everyone’s Talking About It
 - 700+ attendees at PlatformCon Live Day in London
 - 70% had “~ Platform Engineer” in their job title
- But here’s the reality:
 - You need a Platform Team with a product mindset
 - First challenge: finding those engineers
 - Be ready to stack \$\$\$\$ on top of existing costs
 - You’ll need to invest, modernize, and refactor your apps
 - And above all: keep it secure

Just ~~do~~ build it!

3 Common Pitfalls to Avoid When Building an IDP

- 1. Ignoring** the Education Gap
- 2. Building on an Unstable Core**
- 3. Neglecting** Day-2 Responsibilities

1. Ignoring the Education Gap

- Overlooking the **Education Gap**
- **No Full IDP!** Just Self-Service + UI + Docs
- Lack of **Shared Terminology**
- Spoiler: **IDPs Aren't Just for Developers**
- Finding the **Right Abstraction Layer**

2. Building on an **Unstable Core**

- **Focusing** on Everything Except **Workflows**
- Adding **Unnecessary Abstraction** Layers
- Increasing **System Complexity**
- Low **Automation Maturity**

Leg day is for cowards
training to run away

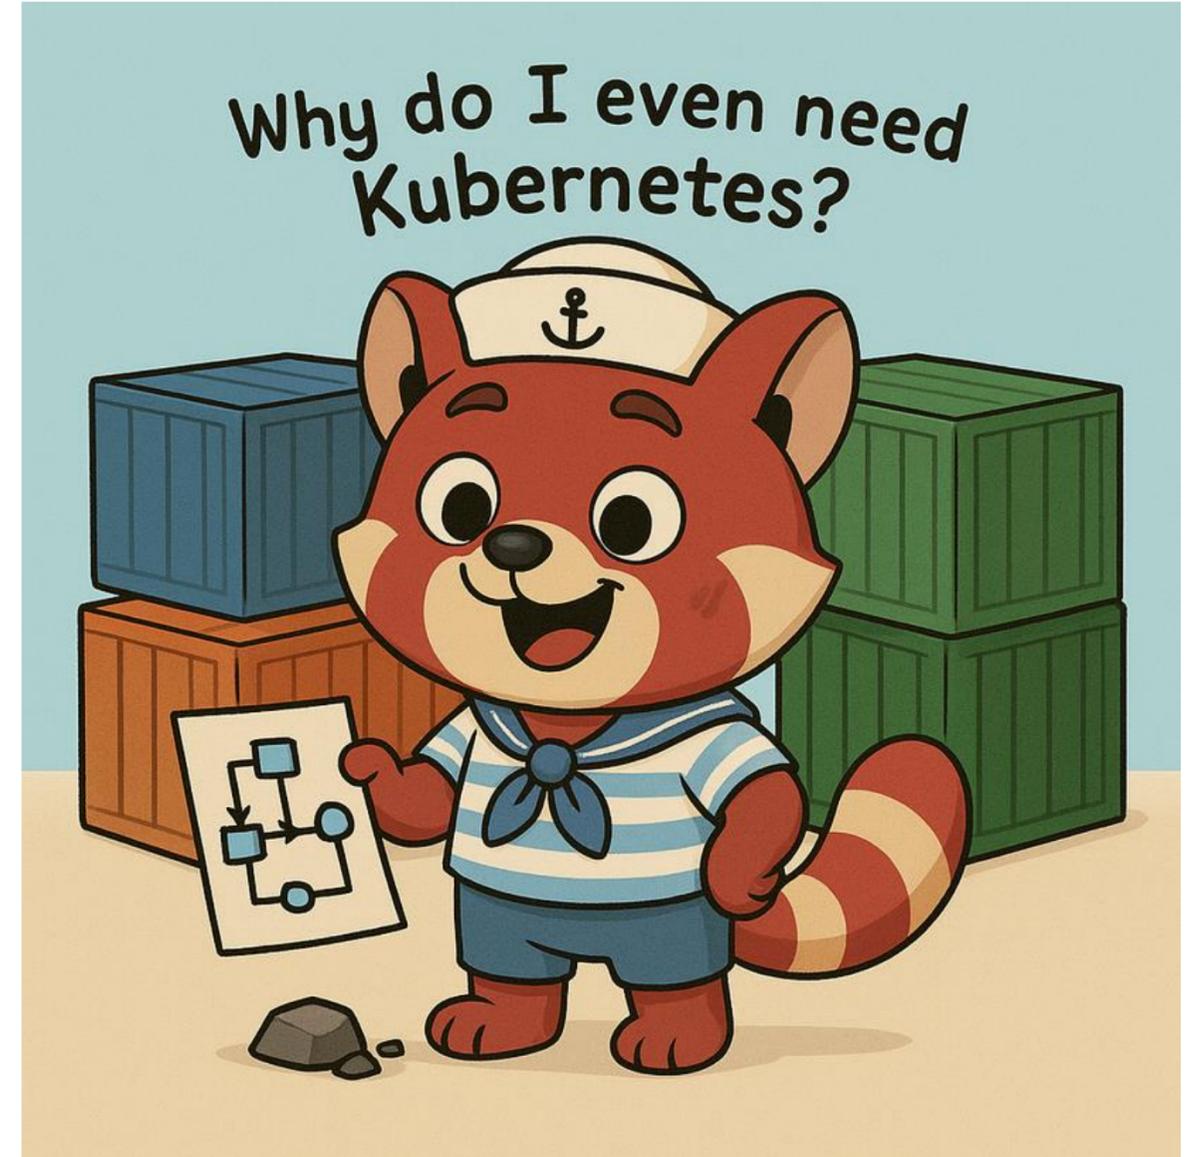

3. **Neglecting** Day-2 Responsibilities

- Who's Responsible for **Day-2 Operations**?
- Easy, right? **User** of the template, of course.
- But here's a simple example:
 - **PE** provides a template upgrade.
 - **Devs** apply the update, and things break.
 - **Devs** blame **PE**, **PE** blames **Devs**.
- What's really going on here?

WHY do I need an IDP?

WHY do I even need Kubernetes?

Why IDP matters!

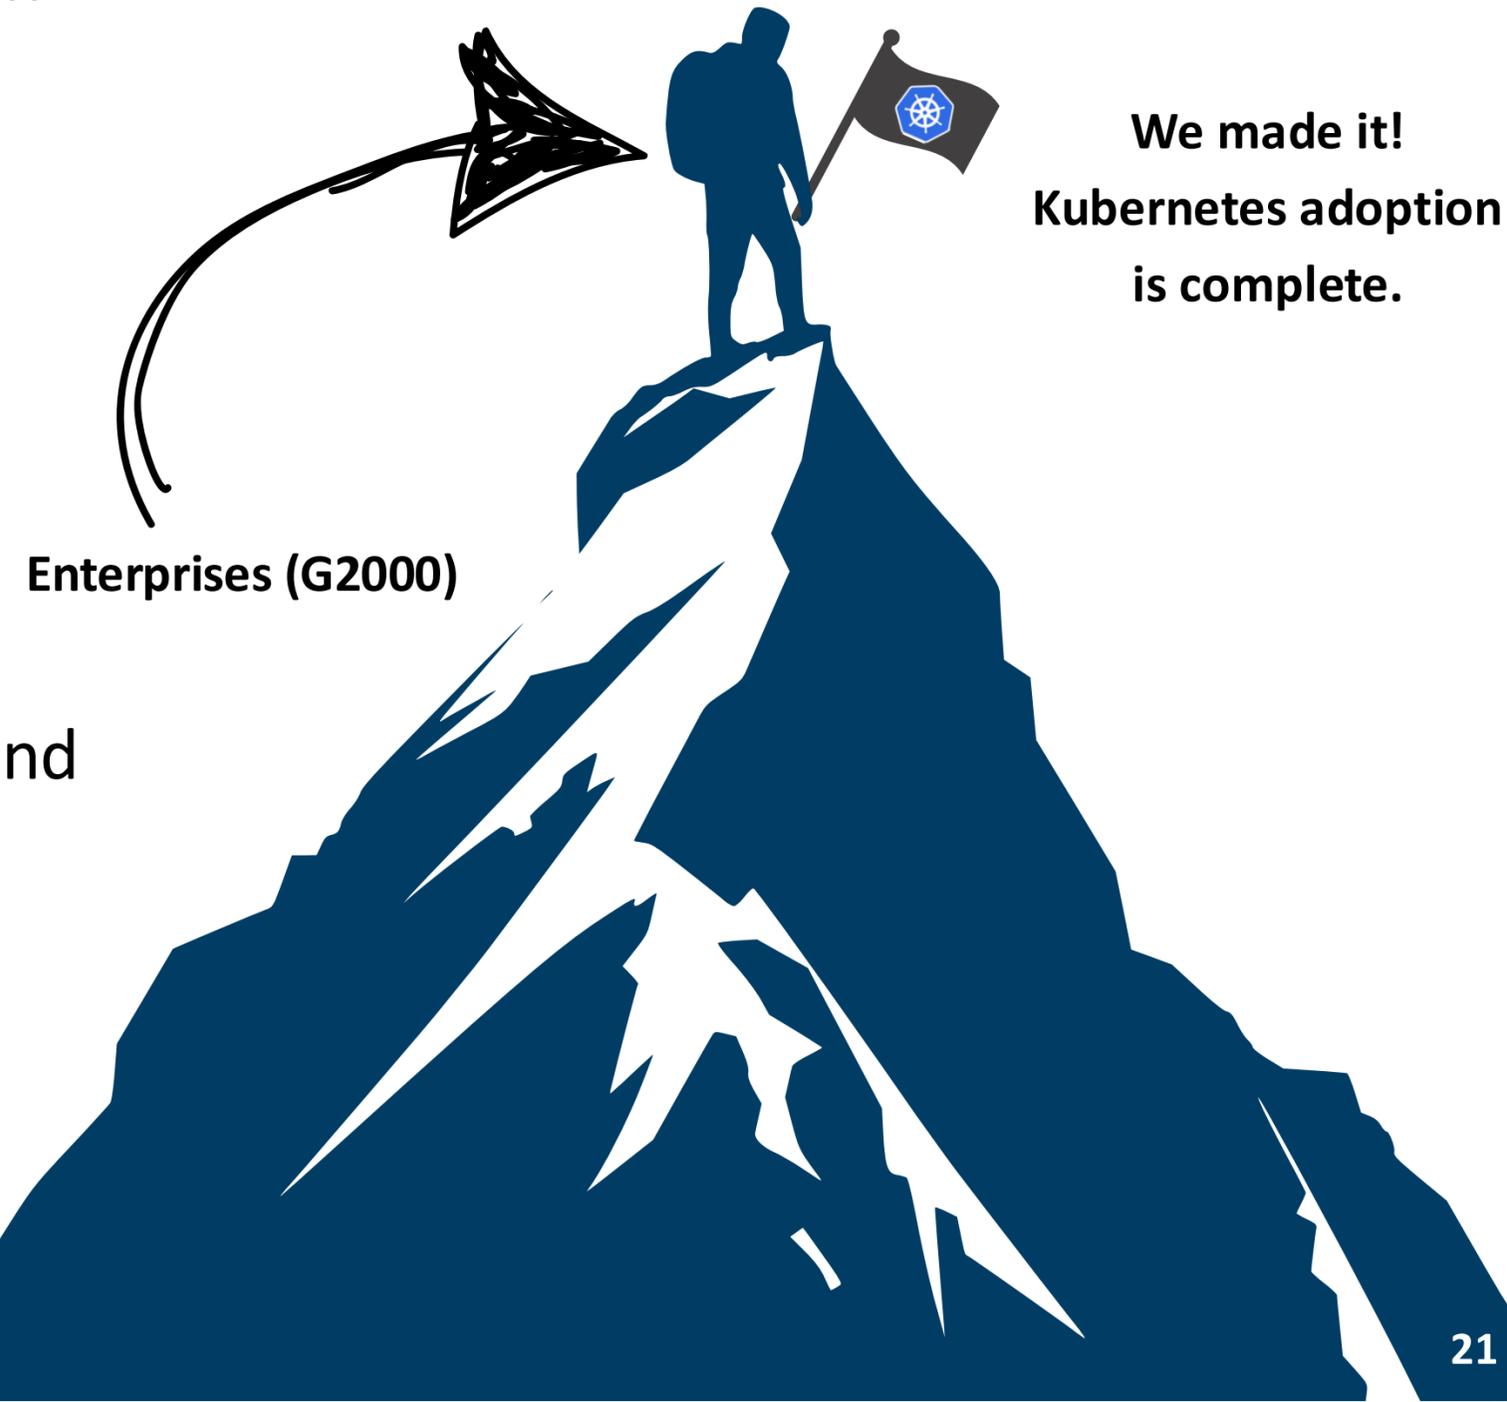

- **Kubernetes** has become the standard for containerization since 2014 (June 6, Joe Beda)
- **By 2027, 90%** of G2000 companies will use container management tools (Gartner)
- In 2023, adoption was below 20% (Gartner)
- **55%** already use platform engineering; **90%** plan to expand it (Google Report)

Gartner

Google Report

Why IDP matters!

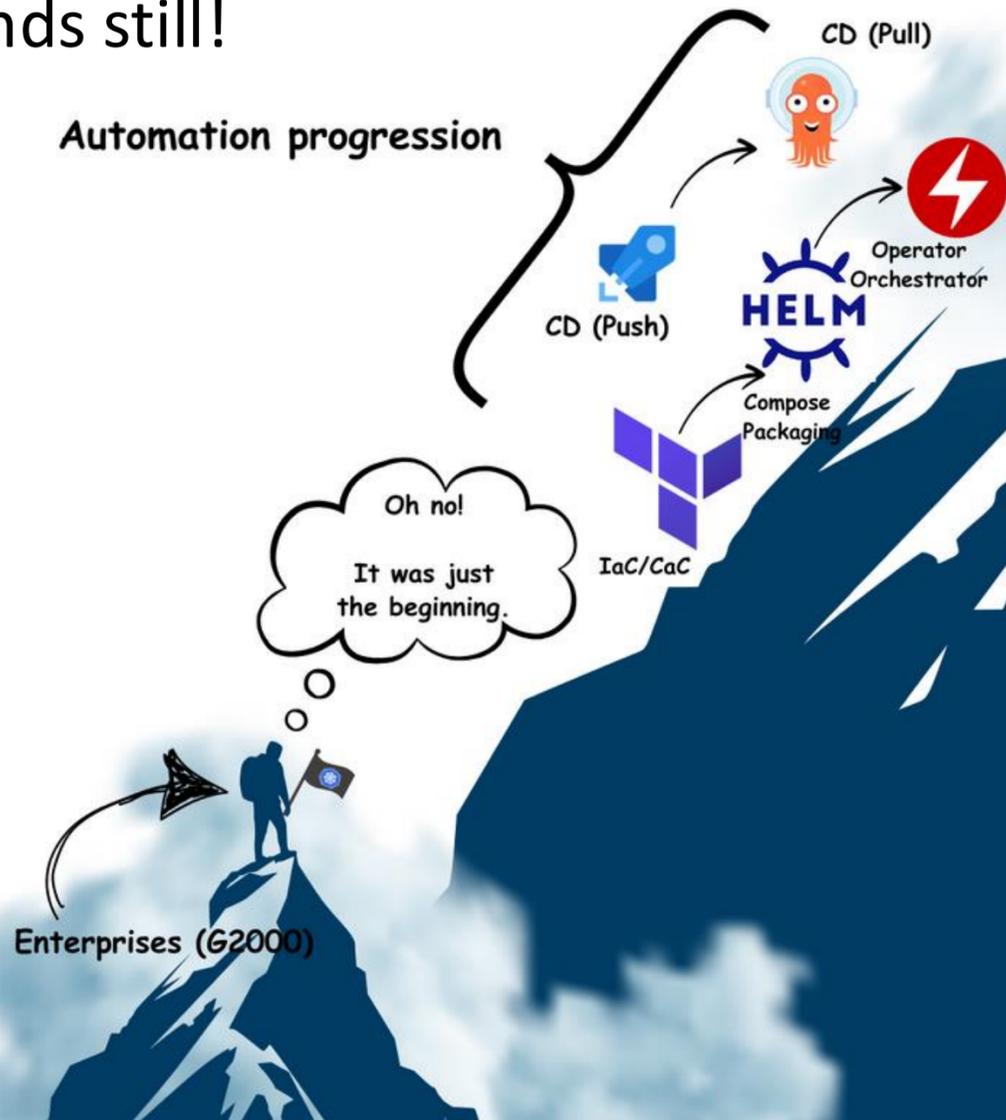

- Portals
- Internal Platforms
- Frameworks

Developer

Congrats!

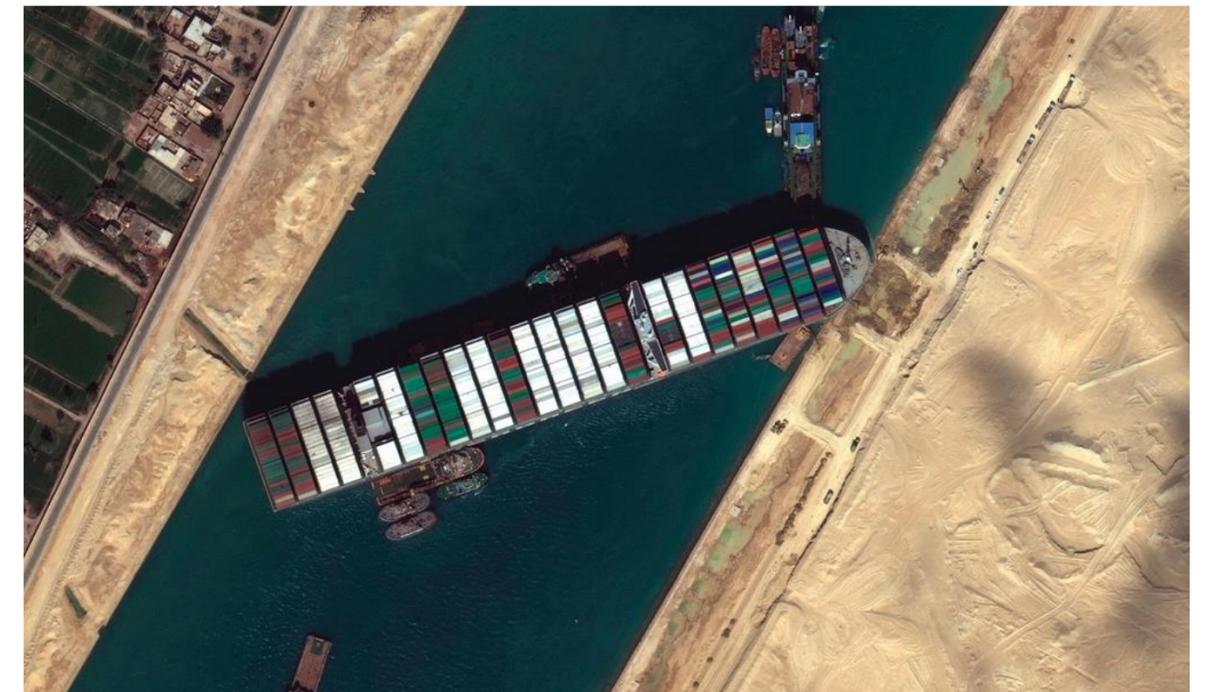

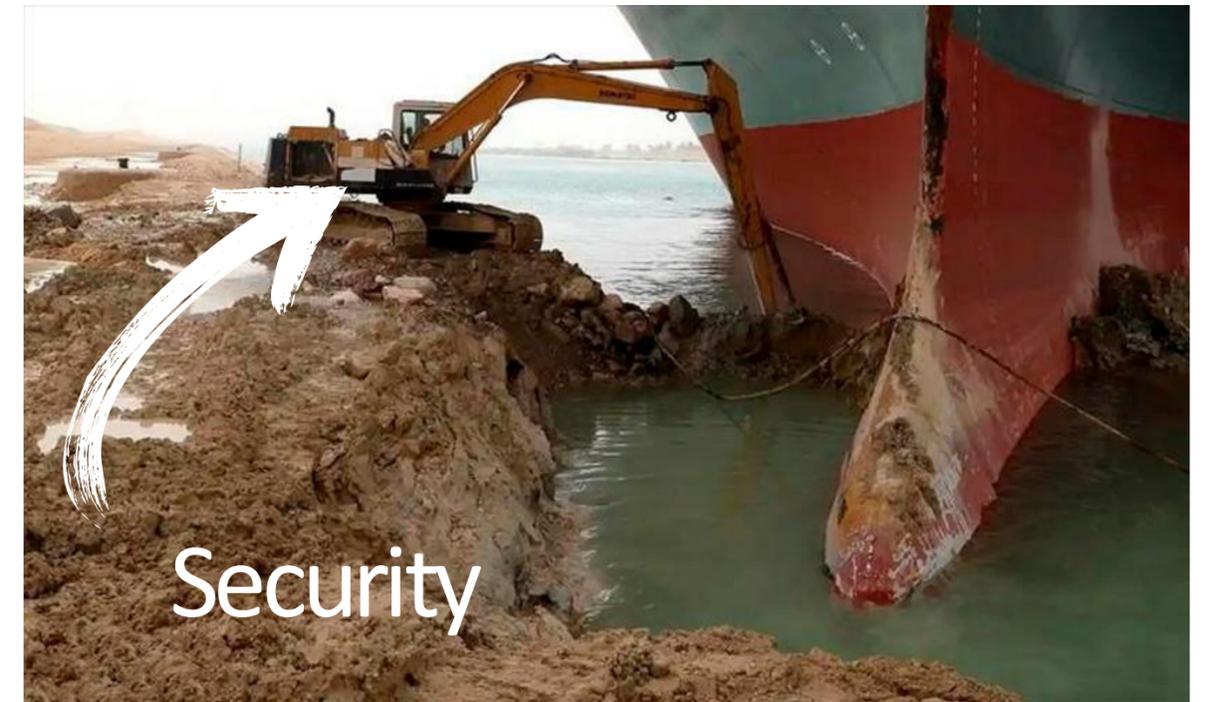

But remember—the world never stands still!

Recap

- There is **no** perfect, **one-size-fits-all IDP** – each organization must build what fits their needs best.
 - **Platform Engineering** is **not** the same as a **managed infrastructure team** – it's about building products for developers, **not** just maintaining infrastructure.
 - **IDPs** and **Platform Engineering** are gaining importance
 - **Don't** build if you're **lacking skills** or **budget** — consider platformless solutions like **Choreo** instead.
 - **AI won't save you. But it will help you!**
-
- The **education gap** is real – don't ignore it!! Start learning and upskilling early. If you're here, you've already started. Education !
